Logistics Operations Platform

Driving Operational Excellence Through Intelligent Logistics Systems

Designed & Developed by Kunal Sur | Version 1.0

Made with GAMMA

Project Overview

End-to-End Platform

Comprehensive system managing every aspect of logistics operations from planning to execution and analysis.

Real Industrial Workflows

Simulates authentic logistics operations with realistic scenarios, constraints, and decision points.

Centralized Control

Single-pane-of-glass view for monitoring, managing, and optimizing all operations from one unified interface.

Made with GAMMA

Core Objectives

Scalable System Design

Architecture built to handle growing volumes, expanding fleet sizes, and increasing operational complexity without performance degradation.

Real-Time Operations Simulation

Live tracking and monitoring capabilities that mirror actual logistics environments, enabling accurate scenario testing and optimization.

Enhanced Efficiency

Comprehensive monitoring tools that identify bottlenecks, optimize routes, and improve overall operational performance.

Made with GAMMA

Dashboard Overview

Real-Time KPI Tracking

Monitor key performance indicators including on-time delivery rates, fleet utilization, and operational efficiency metrics as they happen.

Priority-Based Alert Monitoring

Intelligent alert system prioritizes critical issues, ensuring operations teams focus on what matters most at any given moment.

Centralized Operations Control

Single interface for managing fleet assignments, trip routing, maintenance scheduling, and issue resolution across all operations.

Faster Decision-Making

Real-time data and intuitive visualization enable operations managers to make informed decisions quickly and confidently.

Made with GAMMA

Fleet Management

Vehicle Types

Manage owned, partner, and leased vehicles through unified tracking and assignment systems.

Real-Time Tracking

GPS-enabled vehicle location monitoring with assignment optimization based on proximity and availability.

Maintenance Monitoring

Schedule preventive maintenance, track service history, and monitor vehicle health to minimize downtime.

Asset Optimization

Maximize utilization rates and reduce idle time through intelligent allocation algorithms.

Made with GAMMA

Trip Management Workflow

Complete lifecycle tracking from initial planning through final delivery, improving operational efficiency and accountability.

1. **Create**
   Define trip requirements including origin, destination, cargo type, and delivery windows.
2. **Assign**
   Allocate appropriate driver and vehicle based on availability, location, and capacity requirements.
3. **Monitor**
   Track progress in real-time with GPS updates, delay alerts, and status notifications throughout the journey.
4. **Complete**
   Record delivery confirmation, capture signatures, and close the trip with performance metrics and feedback.

Made with GAMMA

Live Tracking System

Simulated GPS Integration

Realistic vehicle movement simulation with accurate location updates that mirror actual GPS tracking systems used in field operations.

Delay & Deviation Detection

Automatic identification of route deviations, unexpected stops, and schedule delays with immediate alert generation for operational response.

Real-Time Visibility

Operations teams gain complete visibility into vehicle movements, estimated arrival times, and current status across all active trips.

Proactive Decision Support

Early warning system enables operations managers to address issues before they impact delivery commitments or customer satisfaction.

Made with GAMMA

Alerts & Monitoring

Delay Alerts

Automatic notifications when trips fall behind schedule, enabling rapid intervention and communication with stakeholders.

Idle Vehicle Alerts

Identification of vehicles with extended idle periods, helping optimize asset utilization and reduce operational costs.

Compliance Alerts

Monitoring of regulatory requirements, maintenance schedules, and operational standards to ensure compliance.

Ensures rapid operational response to issues, minimizing disruptions and maintaining service levels.

Made with GAMMA

Helpdesk System

Internal communication channel that improves coordination across operations, maintenance, and management teams.

01

Ticket Creation

Report issues through structured ticket system with priority levels and category classifications.

02

Assignment & Routing

Automatic ticket routing to appropriate team members based on issue type and expertise.

03

Resolution Tracking

Monitor ticket status from creation through resolution with complete audit trail.

04

Feedback Collection

Gather user feedback to identify recurring issues and improvement opportunities.

Made with GAMMA

Performance Intelligence (KPI)

95%

On-Time Delivery

Percentage of trips completed within scheduled delivery windows, tracking reliability and customer satisfaction.

87%

Fleet Utilization

Ratio of active vehicle hours to total available capacity, measuring asset efficiency and deployment effectiveness.

2.4h

Avg. Delay

Average delay duration across all trips, identifying operational bottlenecks and improvement areas.

4.6

Vendor Score

Performance ratings for partner carriers based on reliability, communication, and service quality metrics.

Enables data-driven decisions through comprehensive analytics, historical trend analysis, and predictive modeling for continuous operational improvement.
